

Categories	Questions	Response
Input vs. Output	• What are users inputting (for example, audio, text, images)? • What are the outputs or labels your model will predict or generate?	• Text, specifically a well-expressed complaint which can contain misspellings, abbreviations, Nigerian pidgin, Nigerian English and local expression. • A predicted classification label that maps the complaint to a specific Category (e.g., Mobile Data, Network Quality, Billing & VAS), Subcategory, and Intent.
Classification problem	• What is the classification task, if any? • What categories or classes are you working with, and why?	• Multi-class text classification to categorize natural language customer complaints into specific support categories • The dataset utilizes overarching categories like mobile data, network quality, and billing & fraud. These break down into specific intents, such as data depletion, call drops, poor network or credit deduction. These classes allow the system to accurately route issues directly to the correct technical or billing support teams.
Labelling	• Where do your labels come from domain experts, community members, crowd workers, AI generated sources? • How will you check for consistency and accuracy?	• The dataset relies on AI-generated labelling, as indicated by the Auto-Assigned status in the annotations. • We sampled the auto-assigned labels and validate them using human reviewers fluent in Nigerian Pidgin and local dialects.

Data creation	• How will you collect your data? • Will it come from direct sources (like interviews or recordings), or will you synthesize data in low-resource settings (e.g., for under-resourced languages)?	• The dataset gathers inputs from Public sources and supplements them with Synthetic data. • Synthetic generation is explicitly utilized to capture under-resourced language styles, such as Nigerian Pidgin and mixed-language expressions, ensuring the model can handle local phrasing.
Web collection ethics	• Do you plan to source data from the web? • If yes, which sites or platforms? • What tools will you use AI tools, human workers, or both? • Have you addressed issues of consent, copyright, and privacy?	• Yes, public web sources are utilized. • The public data was originated from social media platforms, telecommunications customer service forums, and digital review sites. • We used an automated scraping for public data • To uphold privacy, all scraped data were stripped of Personally Identifiable Information (PII) like phone numbers, names, or banking details.

Bias and representation	• Who might be left out of your dataset? • How will you ensure that the dataset reflects the diversity of the community and includes underrepresented voices?	• Users who complain offline through voice calls, rural populations without internet access, or demographics using indigenous languages without mixing them into digital text. • The dataset explicitly includes Nigerian Pidgin and local expressions to capture diverse voices. To improve representation, future iterations should incorporate text transcripts from offline call centres.
Values and community alignment	• How does your dataset design reflect the values you identified in 01 Build Your Own Small Language Model • How will your community benefit from this dataset, and how will you ensure accountability to them?	• By recognizing Pidgin and local abbreviations, the dataset design reflects fairness and accessibility, ensuring users receive support regardless of their formal English proficiency. • Customers will experience faster response times and more accurate complaint resolution. Accountability is maintained by ensuring the system is continuously evaluated against real-world customer satisfaction metrics.
